Test Name	Result	Bio. Ref. Range	Unit	Method
-----------	--------	-----------------	------	--------

Camp HbA1c , whole blood

HbA1c (Glycated Haemoglobin)	6.2 H	< 5.7 % - Normal 5.7 - 6.4 % - Pre - Diabetic >6.4 % - Diabetic	%	HPLC
Estimated Average Glucose	131.24		mg/dL	Calculated

Interpretation:

Hemoglobin A1c (HbA1c) level reflects the mean glucose concentration over the previous period approximately 8-12 weeks, depending on the individual) and provides a much better indication of long-term glycemic control than blood and urinary glucose determinations. The American Diabetes Association (ADA), International Expert Committee (IEC), and the World Health Organization (WHO) recommend the use of HbA1c to diagnose diabetes, using a threshold of 6.5%. The ADA recommends measurement of HbA1c (typically 3-4 times per year for type 1 and poorly controlled type 2 diabetic patients, and 2 times per year for well-controlled type 2 diabetic patients) to determine whether a patient's metabolic control has remained continuously within the target range.

Falsely low HbA1c results may be observed in patients with clinical conditions that shorten erythrocyte life span or decrease mean erythrocyte age (eg. Hemolytic anaemia).

Specimens from patients with polycythemia or post-splenectomy may exhibit increased HbA1c values due to a somewhat longer lifespan of the erythrocytes.

Therapeutic goals for glycemic control (ADA)- Goal of therapy- '<7.0%' ; Action suggested – '>8.0%
